Comparing Claude, Google Gemini, and ChatGPT

This assignment compares three chatbots: Claude, Google Gemini, and ChatGPT. I gave each one the same four prompts—an open-ended question, a short poem, a French translation, and a U.S. wheat-market summary—so the comparison would be fair. Screenshots of the responses are included below.

My experiment Design

Experiment A -Open-Ended Question

Prompt: What is the meaning of life? Answer in 2–3 thoughtful paragraphs.

Experiment B - Creative Text

Prompt: Write a short poem about working full time and going to school part time.

Experiment C - French Translation

Prompt: Translate this sentence into French: "Machine learning is fascinating and AI will revolutionize our world."

Experiment D - Knowledge / Factual Question

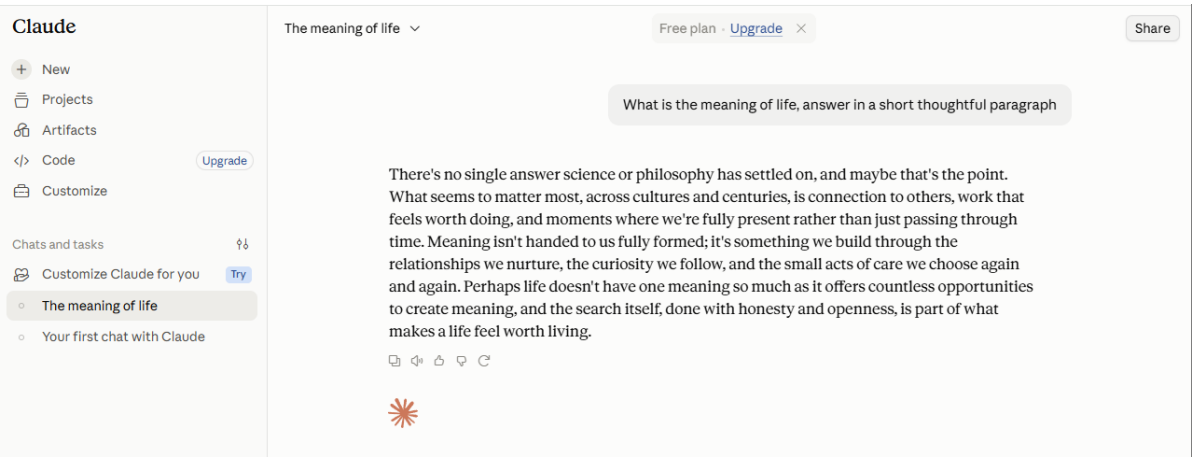

Prompt: What is the current state of the wheat market in the United States? Summarize key trends, prices or supply factors, and challenges in one clear paragraph

Experiment Findings

Experiment A — Open-Ended Discussion (Meaning of Life)

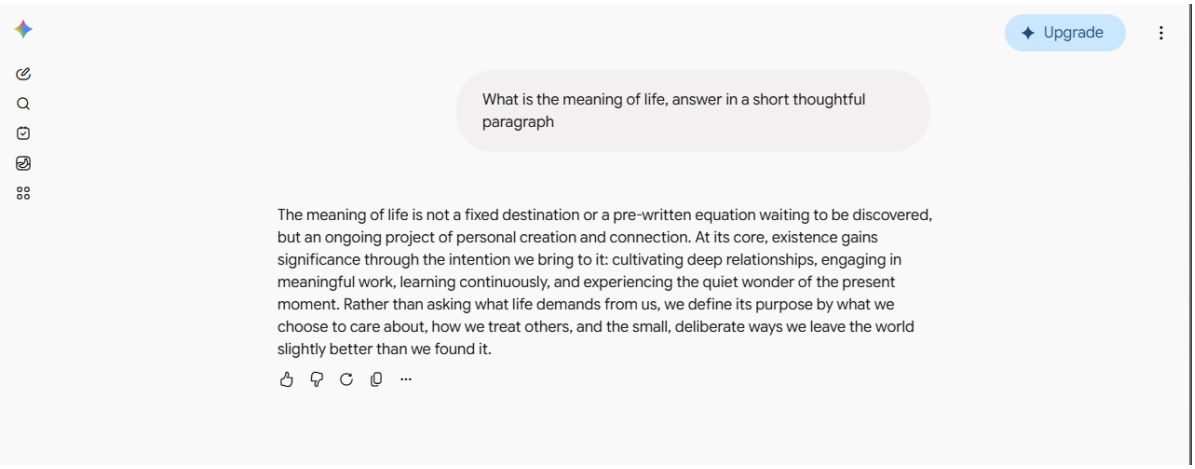

Prompt: “What is the meaning of life, answer in a short, thoughtful paragraph.” I liked this example because secretly I hoped one of the chatbots would respond with “42” and make Douglas Adams, author of The Hitchhiker’s Guide to the Galaxy, proud. No success on that front, but it was very interesting.

Claude

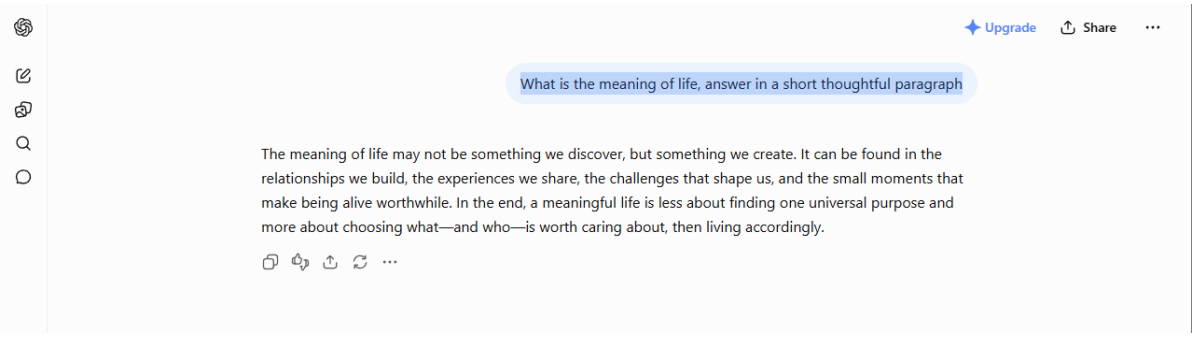

Claude gave a thoughtful answer that focused on connection, meaningful work, and being present. It didn't claim there's one scientific meaning of life. It argued that meaning is something people build. It was clear and easy to follow, and the tone felt more personal than robotic.

Google Gemini

Gemini also treated meaning as something you build rather than find, and it hit a lot of the same ideas as Claude. The wording felt more polished and less personal. It stayed on topic, just not as warm.

ChatGPT

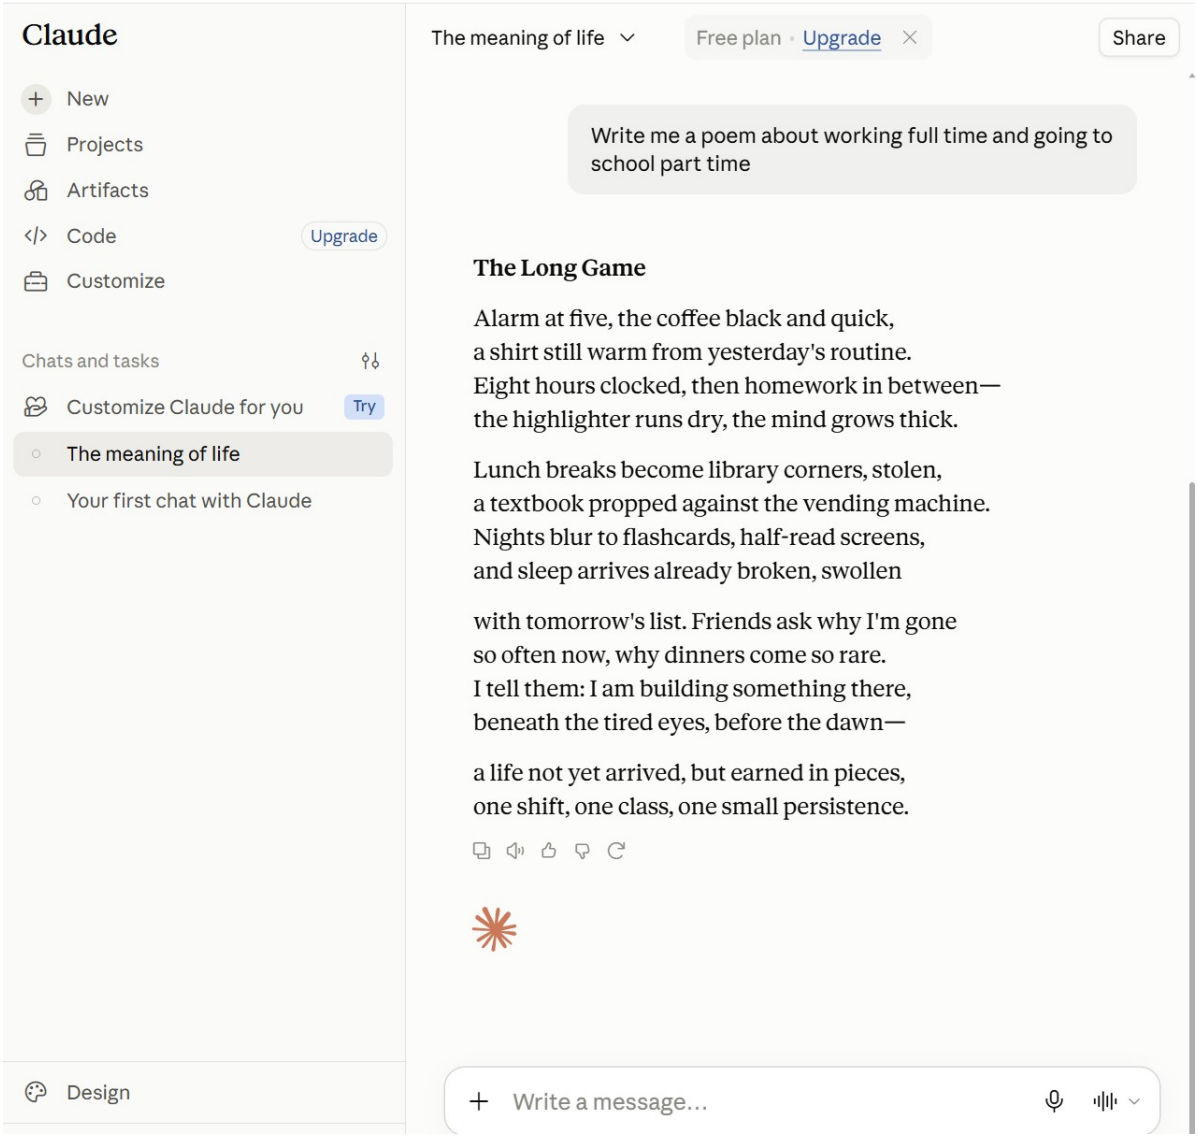

ChatGPT's answer was the shortest and most direct. It also tied meaning to what people choose to care about and build. It matched the prompt and was easy to understand, but it had less depth than Claude or Gemini and less warmth than Claude.

Experiment B — Creative Writing (Full-Time Work + Part-Time School Poem)

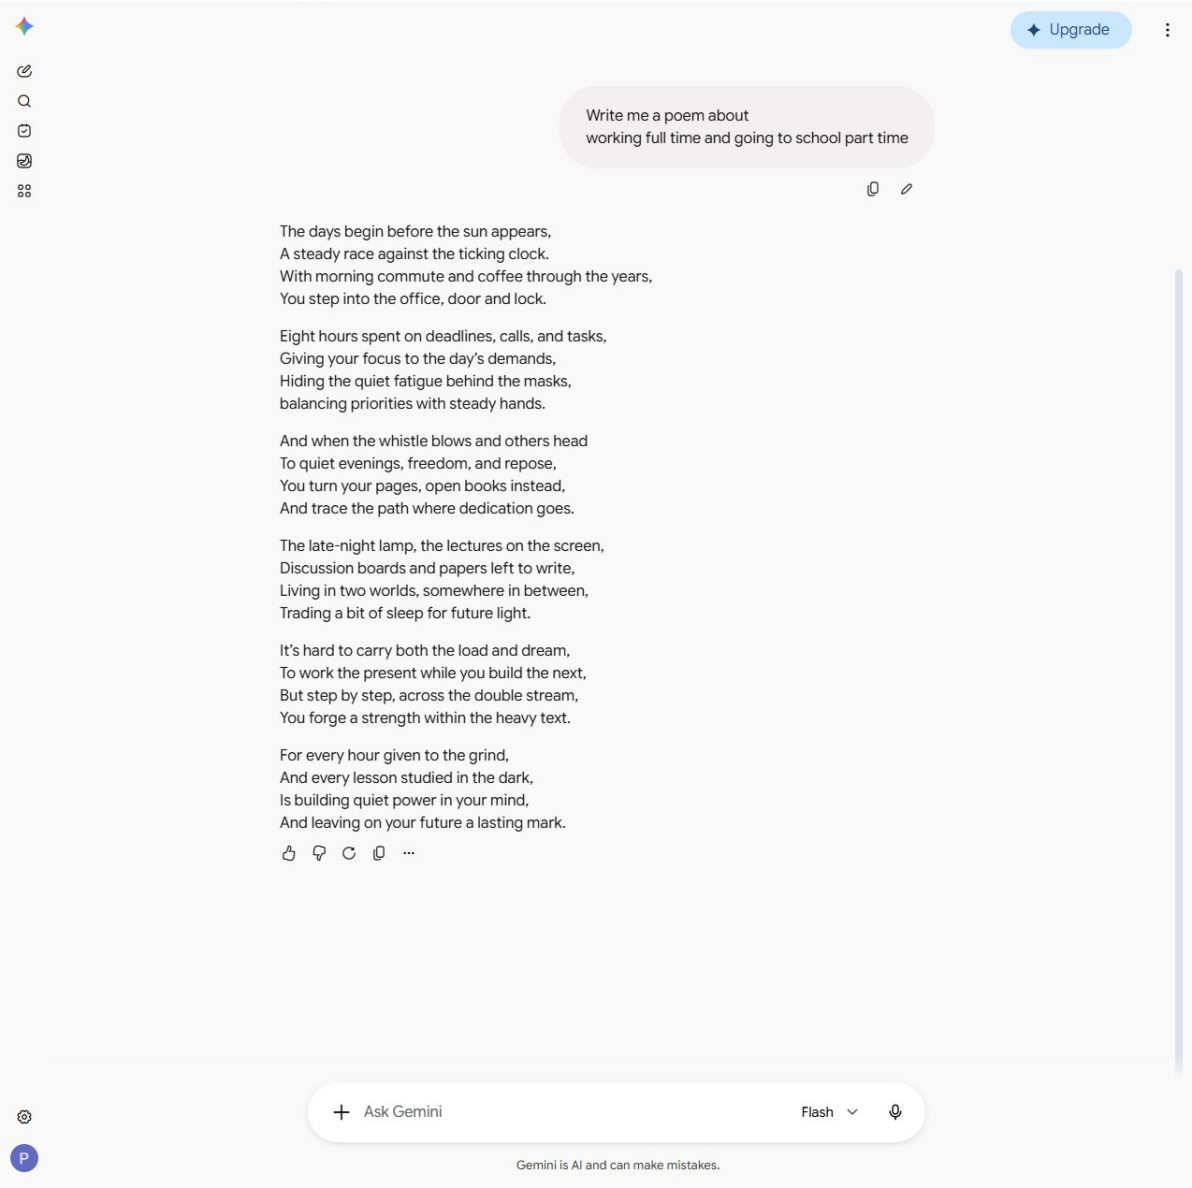

Prompt: "Write me a poem about working full time and going to school part time."

Claude

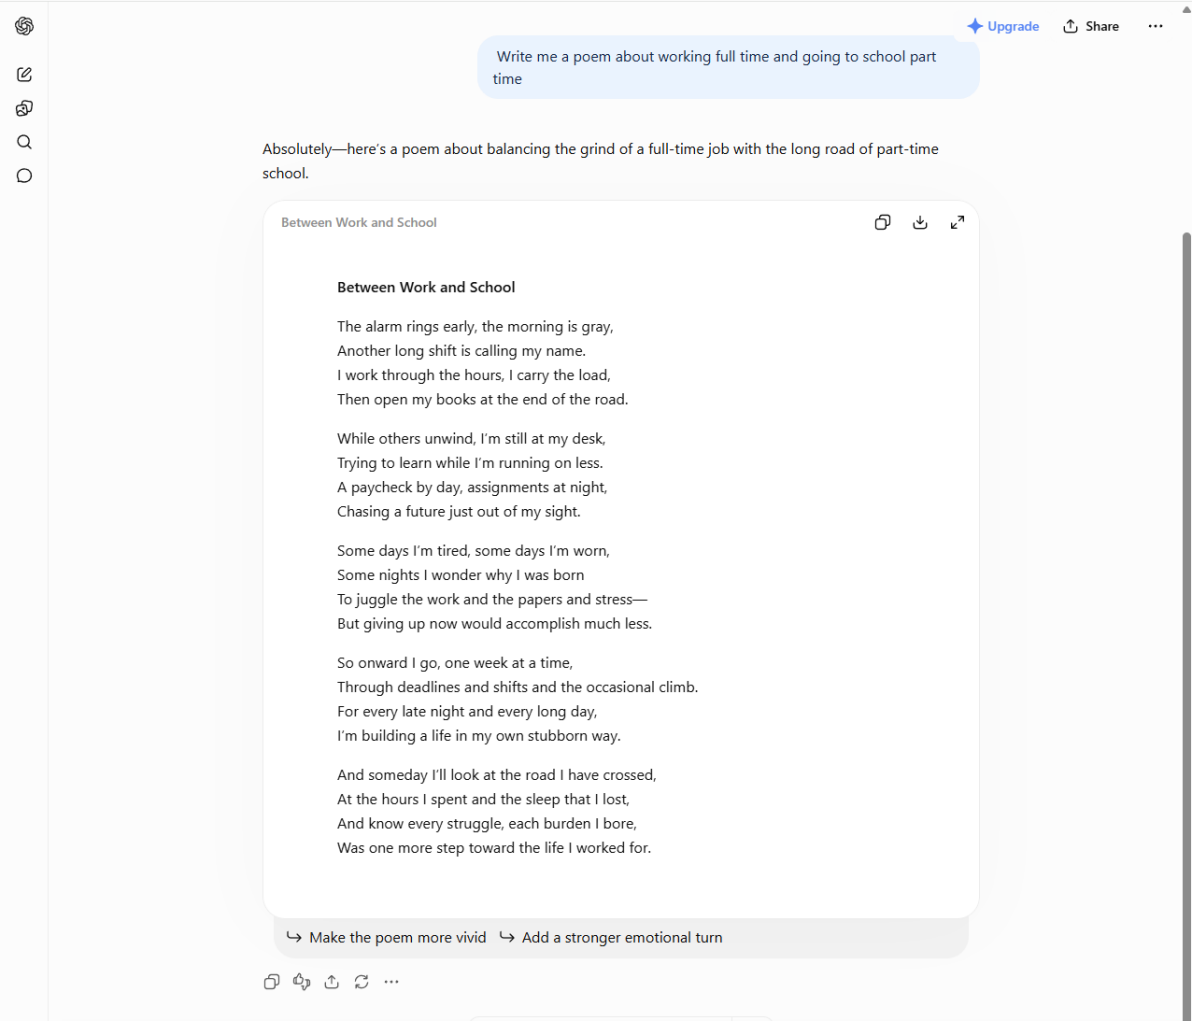

Claude wrote a poem titled “The Long Game” with a very easily imagined style—early alarms, lunch-break studying, and friends noticing you’re gone. It stayed on prompt and felt specific, with strong images and a clear ending about building a future “one shift, one class, one small persistence.” I really liked how it framed this prompt, although the structure isn’t perfect.

Google Gemini

Gemini produced a longer poem about early mornings, office deadlines, night classes, discussion boards, and trading sleep for “future light.” It followed the prompt well, stayed coherent from start to finish, and built a fuller mental image than Claude in places. The language was clear and encouraging, though a bit more predictable and motivational than Claude’s.

ChatGPT

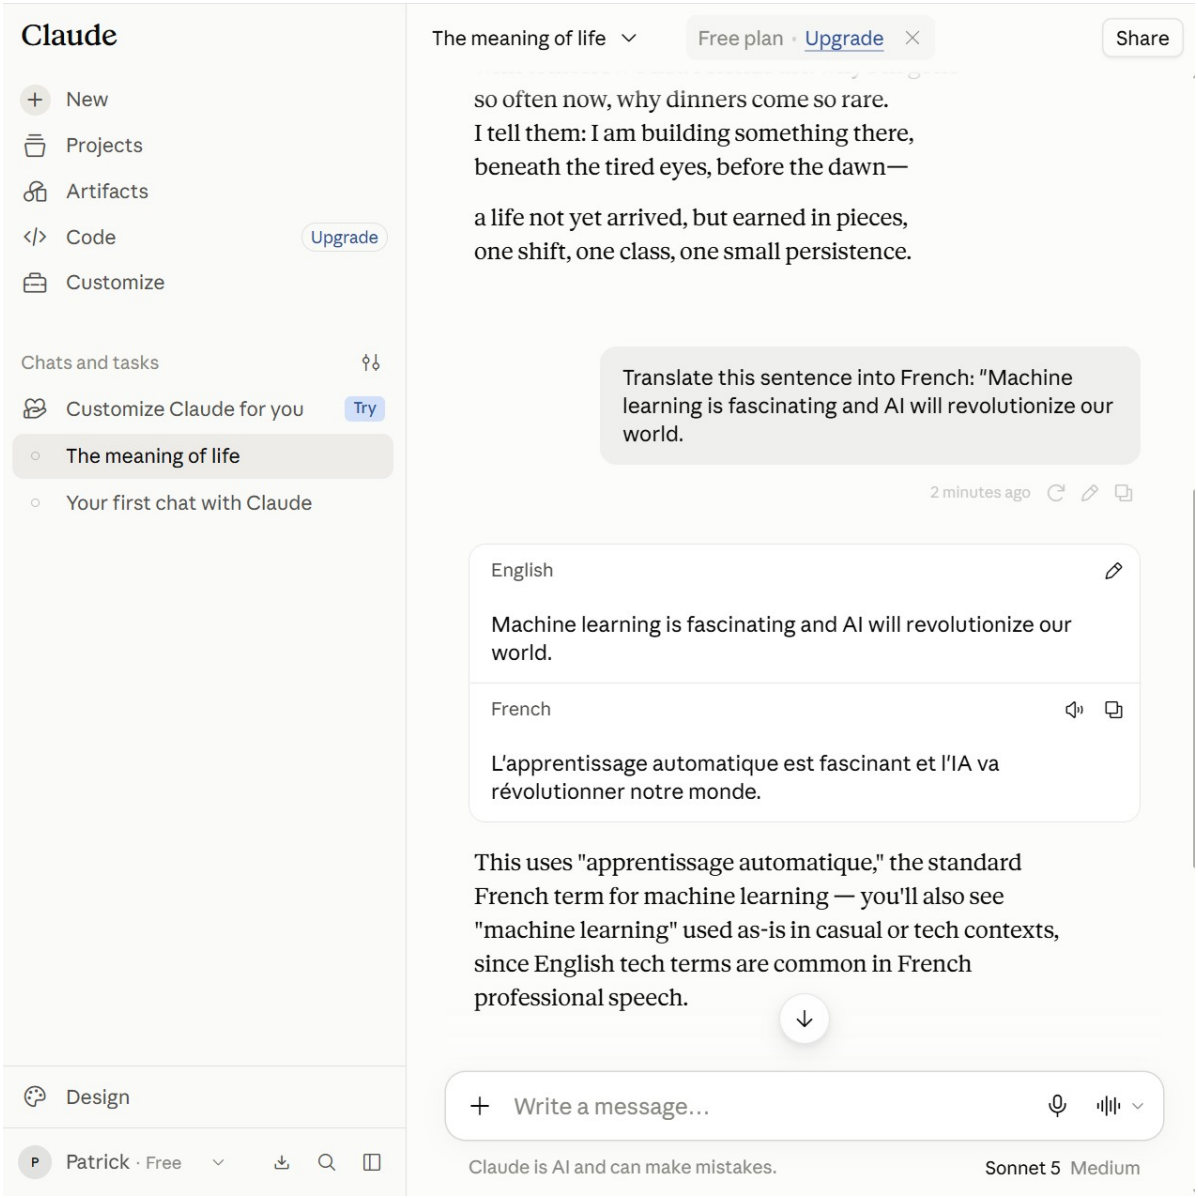

ChatGPT's poem was straightforward and easy to follow. It matched the prompt and ended on a hopeful note. It was simpler than Claude's and shorter than Gemini's, more like something you'd actually say out loud.

Experiment C — Translation (English → French)

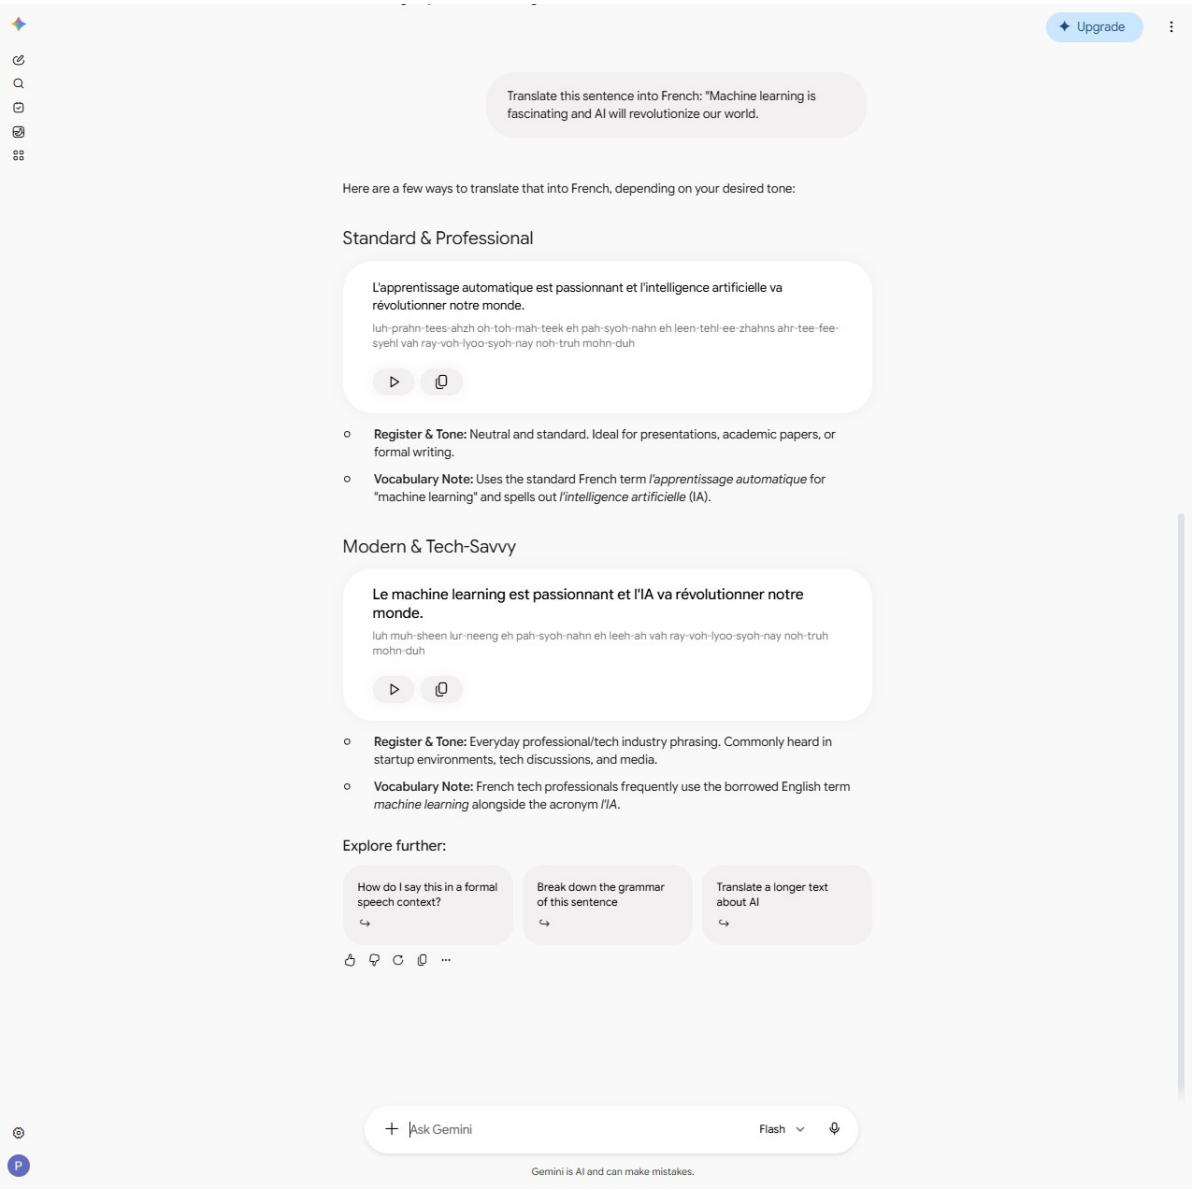

Prompt: Translate this sentence into French: "Machine learning is fascinating and AI will revolutionize our world."

Claude

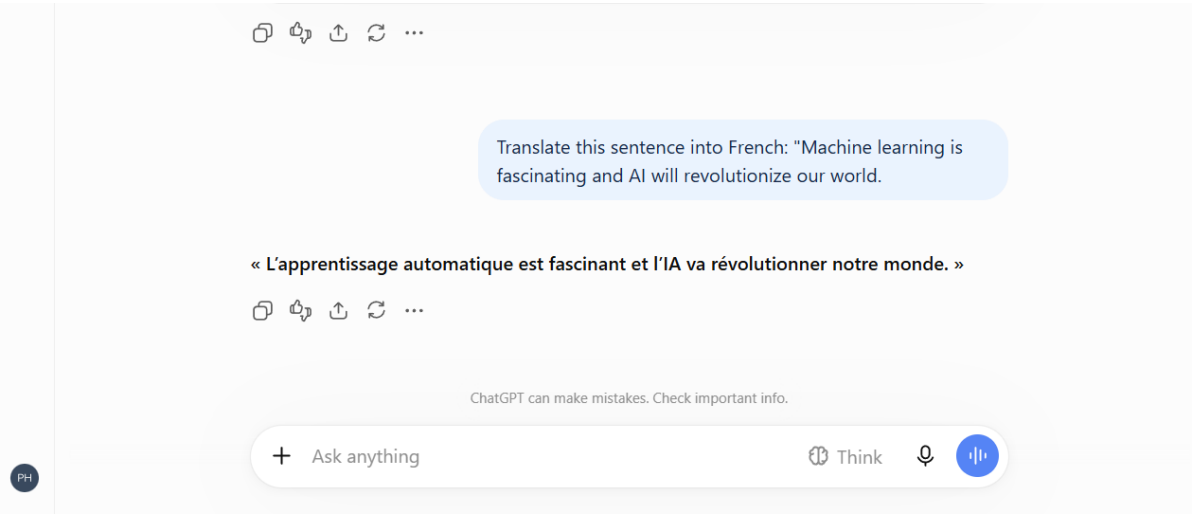

Claude's translation is accurate but doesn't give much context for why each word has a certain gender or other detail that may be important for learning the language. The note for tech contexts and syntax is interesting however

Google Gemini

Gemini gave two French options—one more formal and one more casual, plus pronunciation help. Both preserved the meaning of the English sentence and stayed on prompt. This was an extremely useful response as it gives much more context and information about the translation which is helpful for learning a language

ChatGPT

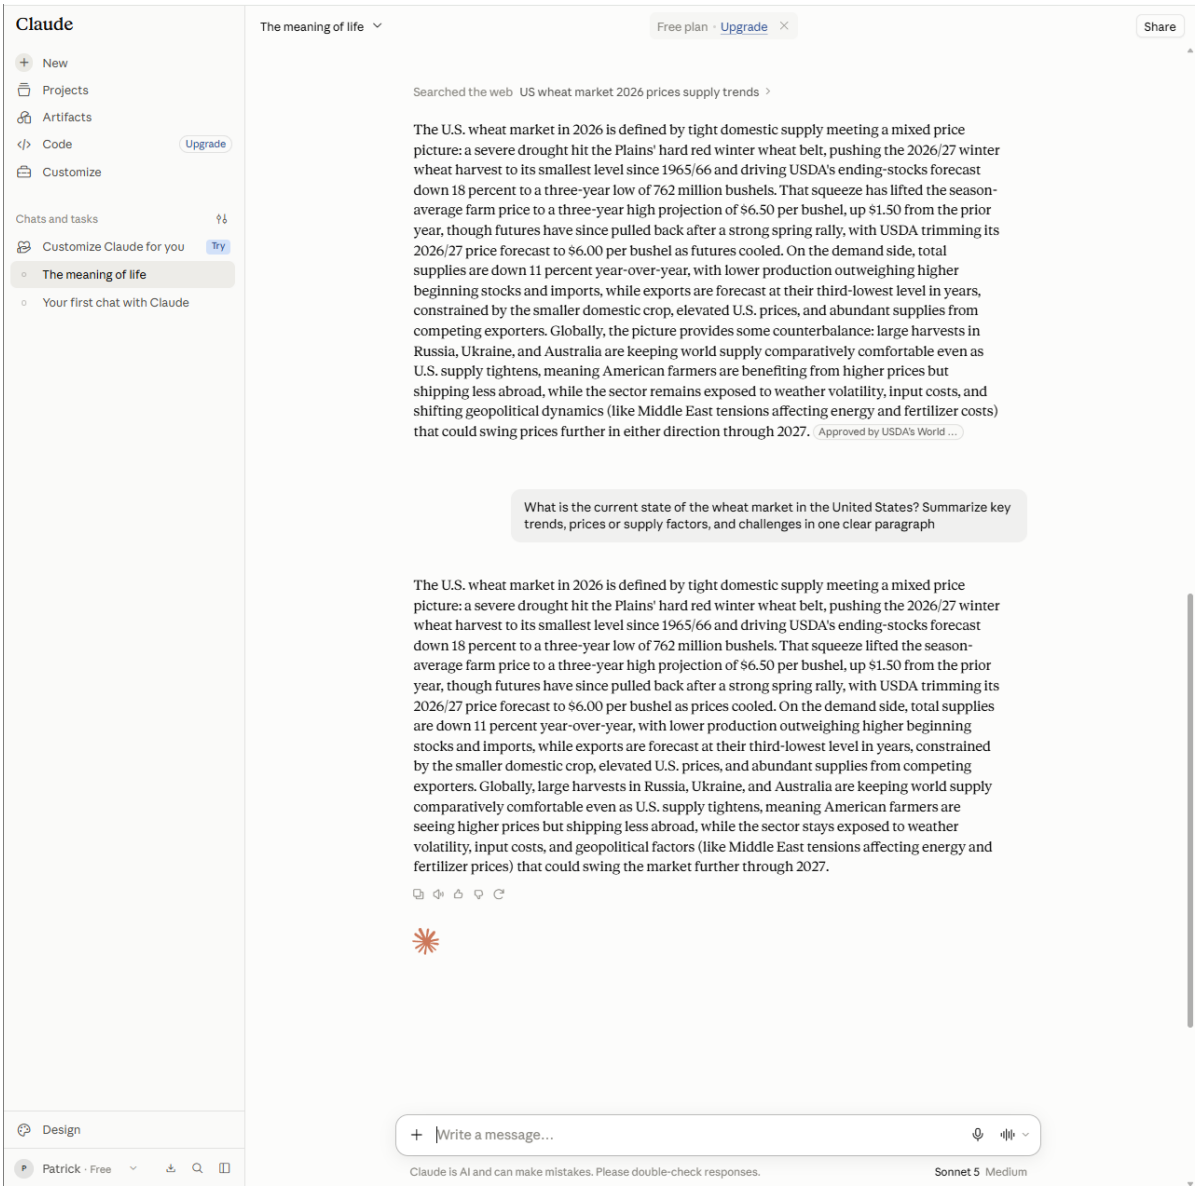

ChatGPT returned a single clear translation. It was accurate and easy to read, with no extra explanation, but also lacked detail much like Claude's response

Experiment D — Specific Knowledge (U.S. Wheat Market)

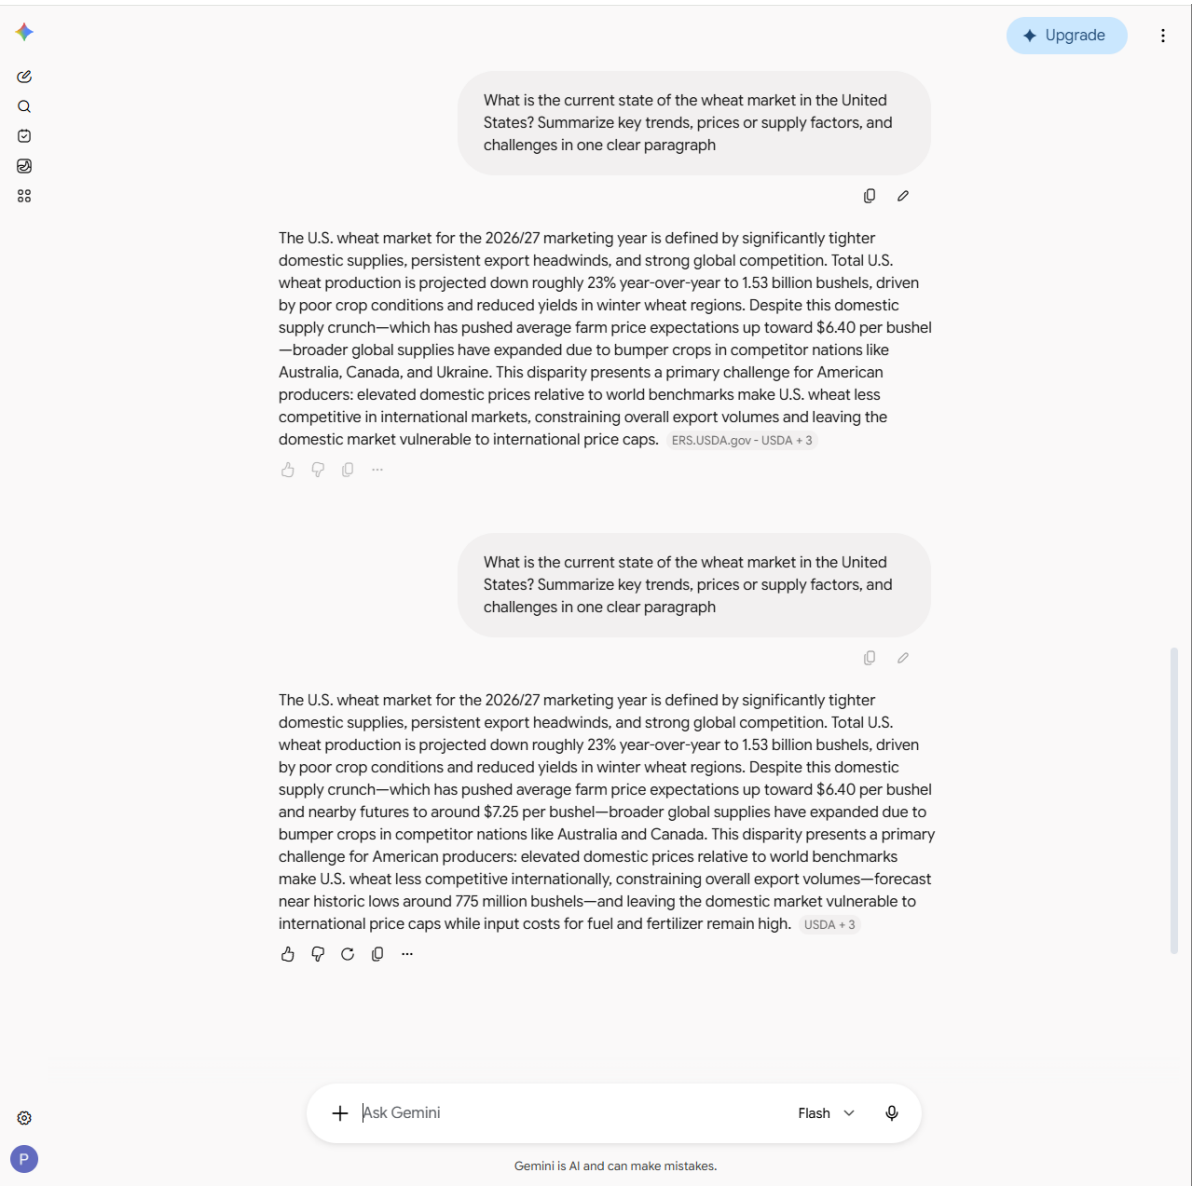

Prompt: "What is the current state of the wheat market in the United States? Summarize key trends, prices or supply factors, and challenges in one clear paragraph."

Claude

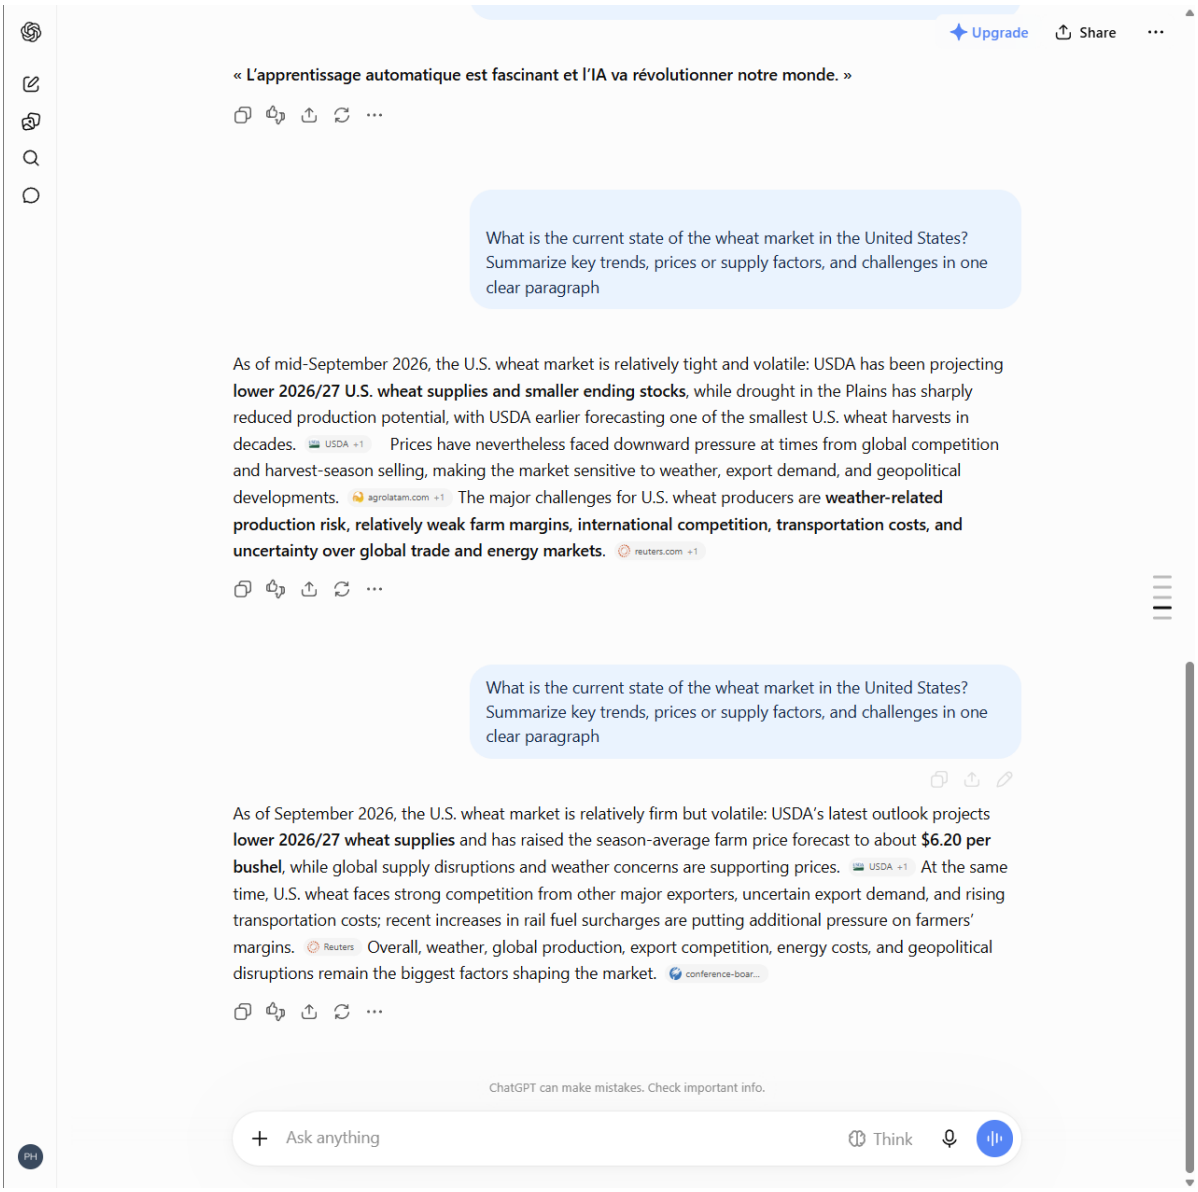

Claude used web search and summarized the U.S. wheat market as tight domestic supply with higher farm prices, drought pressure on hard red winter wheat, lower ending stocks, and global competition from other exporters. It also mentioned weather, input costs, and geopolitical risk. The answer stayed in one clear paragraph and matched the prompt. When the same prompt was asked twice, it provided the same answer with no change.

Google Gemini

Gemini also described tighter U.S. supplies, production declines, price levels, export pressure, and competition from other countries, and it cited USDA-related sources. When I asked again, it stayed on the same themes with a few different details—same overall answer as Claude's double run, just not word-for-word identical.

ChatGPT

ChatGPT summarized a tight, volatile U.S. wheat market with drought-related supply pressure, global competition, and challenges like weather risk, margins, transportation, and trade uncertainty. It stayed in one paragraph like I asked. When I ran the prompt a second time, the answer covered the same ground with slightly different wording.

Analysis of Results

4.1 Accuracy & Relevance

All three chatbots basically did what I asked on every task. They each gave a short take on the meaning of life, a poem about working full time and going to school part time, a French translation, and a one-paragraph wheat-market summary. The wheat answers had real-looking market details. Gemini and ChatGPT showed source cues; Claude used web search but didn't cite anything, which bothered me if I were using this for research. The info

looked relevant enough for the assignment, but I'd still check numbers against the CME or another primary source before trusting them.

Creativity

Creativity showed up most on the poem task. Claude's "The Long Game" felt the most original to me—specific images, a strong ending, and pacing that actually held my attention. Gemini's was longer and motivational, with solid detail about early mornings and discussion boards, but it got a little long-winded. ChatGPT's was clear and emotional, just simpler and less memorable. They all hit similar work/school themes, which makes sense, but each one still sounded different.

Clarity & Coherence

All three were easy to follow. Claude felt warm and organized without getting messy. Gemini was clear and often more formal—especially on translation, where it laid out options neatly. ChatGPT was the easiest to skim. Nothing in the screenshots felt confusing or off-topic. Gemini was the clearest on translation because it actually explained the choices.

Speed & Consistency

All three answered fast enough that I'd actually use them for school. For the wheat-market part, I submitted the same prompt twice to each chatbot on purpose. Claude's two answers were basically the same paragraph—same supply, price, and export points. Gemini kept the same core story both times (tighter U.S. supply, competition abroad, price pressure) but added a little more detail the second time. ChatGPT kept the same overall picture too, just with small wording changes. So they were consistent, which is good, but I'd still fact-check anything important.

Strengths, Weaknesses, and Best Fit by Task

Claude — Strengths: Natural tone, strongest creative writing, clear structure

Claude — Weaknesses: Sometimes less detailed than Gemini on translation options; market facts still need verification, and did not cite sources, which can make research difficult.

Gemini — Strengths: Thorough translation help, strong organization, good for current-topic summaries with source cues.

Gemini — Weaknesses: Can be wordier; creative writing felt more generic than Claude.

ChatGPT — Strengths: Fast, concise, easy-to-read answers that don't get too technical.

ChatGPT — Weaknesses: Less depth/detail than the other two on open-ended, creative, and translation tasks. This could be difficult when researching topics or summarizing things.

Step 4: Conclusions & Insights

Claude

Claude was my favorite for writing that sounded natural. The meaning-of-life answer felt warm and reflective, and the poem (“The Long Game”) was the most creative of the three. The French translation was accurate and had a short note about vocabulary, which helped a little. On the wheat market, it used web search and gave a clear paragraph, but it didn’t cite sources. I’d pick Claude first for open-ended or creative work; it’s fine for facts and translation, just not the best at those.

Google Gemini

Gemini was the most thorough. The meaning-of-life answer was polished but more formal than Claude’s, and the poem was longer and more motivational than creative. Translation is where it really won—two French options plus explanations, which is actually useful if you’re trying to learn. The wheat summary had source cues and stayed consistent when I repeated the prompt. I’d use Gemini when I want detail or help understanding a language answer.

ChatGPT

ChatGPT was clear and fast. Its meaning-of-life answer was shorter, the poem was simpler than Claude’s, and the French translation was correct but didn’t explain much. The wheat answer stayed on prompt and was easy to read. It didn’t go as deep as the other two, but it still got the job done when I just needed something quick.

Overall insights

If I had to choose: Claude for brainstorming and creative drafting, Gemini for translation and research-style summaries with sources, and ChatGPT when I need a fast first pass. None of them replace checking the facts yourself—especially market numbers—before you use the answer for anything that matters.
